

Threat Intelligence & Threat Gathering Concepts (CS0-003)

Introduction

Objective

Welcome to the **Threat Intelligence & Threat Gathering Concepts** Practice Lab. In this module, you will be provided with the instructions and devices needed to develop your hands-on skills.

Overview

Learning Outcomes:

In this module, you will complete the following exercises:

- Exercise 1 – Collection Methods and Sources
- Exercise 2 – Threat Intelligence Hunting and Sharing

After completing this module, you should be able to:

- Know about Open Source Intelligence (OSINT)
- Work with OSINT Tools
- Employ Incident Response using SIEM
- Use a Honeypot Tool
- Use MITRE ATT&CK to Identify Tactics, Techniques, and Procedures (TTPs)
- Access and Research Logs using Windows Event Viewer
- Enable Firewall Logging

Exam Objectives:

The following exam objectives are covered in this module:

- 1.4 Compare and contrast threat-intelligence and threat-hunting concepts

Exercise 1 – Collection Methods and Sources

Information such as news stories, magazine features, user-uploaded videos and photographs on social networking sites, blogs, forums, government bulletins, deep and dark web searches are all examples of sources used in OSINT. The use of OSINT is crucial in both governmental and private investigations. As the rate at which new data is being generated increases, it is more crucial than ever that analysts develop effective strategies for locating, cataloging, and analyzing the data at their disposal.

Analysts will look all over the Internet for readily available information anyone can access. Accessing this data also leaves no trace that can be used to figure out what happened. So, it is important for organizations to limit their digital footprint, which can expose the company to a cyber-attack. Exposure of priority information like executive email addresses, phone numbers, employee names, in-depth about pages, website code build analysis, wireless network analysis and packet inspection, image processing and other things that threats could use.

In this exercise, you will learn about collection methods and sources.

Learning Outcomes

After completing this exercise, you should be able to:

- Know about Open Source Intelligence (OSINT)
- Work with OSINT Tools

Your Devices

You will be using the following devices in this lab. Please power these on now.

- **ACIDC01** – Windows Server 2022 – Domain Controller
- **ACIWIN11** – Windows 11 – Domain Member Workstation

Task 1 – Know about Open Source Intelligence (OSINT)

In this task, you are going to manually explore the ACI learning website and look for potential pieces of information that are being shared that threat actors may be interested in. Some information will be necessary because customers need to contact us. Some of the information may be overshared and can be used to further research and find information on the company and its employees.

1

Click the **Start** button.

2 **Connect** to **ACIWIN11**.

Click **Send Ctrl+Alt+Delete button** on the top of the screen.

Username: **ACIPLAB\Administrator**

Password: **Passw0rd**

Click the **Microsoft Edge icon** on the Taskbar.

3 Microsoft Edge is displayed.

In the **address bar**, **type** the **following** and **press** Enter:

acilearning.com

4 The **ACI Learning webpage** is displayed.

If required, **click** **Accept** on the **pop-up window**.

Explore our exclusive training libraries:

IT & Cybersecurity

Internal Audit

Cyber Awareness

5 Click the ... icon on the browser (**Ensure** you are **not** clicking the ... on the virtual machine)

Click **More Tools** and the **Developer Tools**.

6 The **DevTools** pane is displayed.

Click **Elements**.

7 The **HTML Code** for the website is displayed.

Analysts will use the DevTools primarily for the detection of bugs, the execution of instructions, the verification of variable values, and so on.

If there are flaws in the code, it can reveal unwanted information and present a vulnerability for those who are looking.

Click Close on the **DevTools** pane and **leave** the **window open** for the next task.

Task 2 – Work with OSINT Tools

The manual process of researching and uncovering useful information can be time-consuming. Tools available can help reduce the time spent researching by automating the process. Some tools are free to use, while others may only offer a free trial to allow users to see the benefits and power of their product. A benefit to using a closed source (pay service) is increased customizability, ease of integration, and reduced non-essential information. In this task, you will review some popular tools used in OSINT gathering.

- 1 **Ensure** you are connected to **ACIWIN11** and the **Microsoft Edge browser window** is open.

Type the **following** into the **address bar** of **Microsoft Edge** and **press Enter**:

wayback.archive.org

- 2 The **Internet Archive Wayback Machine website** is displayed.

This site houses different versions of a website that may exist.

This is a great way to see information exposure over time.

Type the **following** in the **search bar** and **press Enter**:

acilearning.com

3 You can see the site was saved numerous times over the span of the years from 2011 to the present.

Click 2011.

4 Click February 2, 2011, and then click the time, 10:17:34, that appears to access the site snapshot from that day.

5 Here you can see a much different site than was previously accessed and how the company has changed over time.

 **Note:** The intel471.com website is a live website and is subject to change without notice. Screenshots may appear out of sync with the website or the address might not work.

6 In the address bar, type the following and press Enter:

<https://intel471.com/titan/cyber-threat-exposure>

7 The Intel471 website is displayed.

If a prompt appears, click Accept Cookies.

This site houses several products that can help with cyber security needs.

8

Here you can see this application uses over **200 OSINT** sources to map out an organization's digital footprint.

This can be a very useful tool for an analyst to speed up the research process.

9

In the **address bar**, **type** the **following** and **press Enter**:

<https://builtwith.com>

ALERT: If prompted, please sign up for a free trial account to ensure the next steps will work accordingly using a personal email account for example: **Gmail**.

10

BuiltWith profiles a domain to quickly find internet assets associated with it and conduct passive surveillance.

In the **search box**, **type** the **following** and **click** **Lookup**:

The **Company** page is displayed.

Here you can see where ACI Learning is active worldwide, organizational information, and how they use technologies over time.

The screenshot displays the 'Company' tab for ACI Learning on the BuiltWith website. The page is divided into several sections:

- ACI Learning Company Information:**
 - Best Domain:** acilearning.com. This is ACI Learning's top ranking domain based on traffic/page rank.
 - Global Footprint:** 1. ACI Learning has related connections in 1 country.
 - Web Technology Spend:** \$34,192 USD/year. ACI Learning has \$34,192 of current detectable web technology spend per year.
 - Decreasing Spend:** ACI Learning has decreased their detectable technology spend in the last 12 months.
 - Technology Consolidation:** ACI Learning has decreased the amount of technologies in use in the last 12 months.
- Addresses:**
 - Colorado Springs CO, 80920 United States
- Telephones:**
 - United States - Colorado: +1-303-788-0513, +1-719-596-4545
 - United States - Florida: +1-904-399-3555
 - United States - Texas: +1-972-215-7738, +1-210-277-4799
- Other Names:** We did not find any other names for ACI Learning.
- People:** We did not find any contacts at ACI Learning.
- Associated Domains:** We did not find any associated domains.

15

In the **address bar**, **type** the **following** and **press Enter**:

intelx.io

16

The **Intelligence X** webpage is displayed.

This is a search engine for domains.

In the **search box**, **type** the **following** and **click** **Search**:

acilearning.com

17

Here you can see the search has found a wealth of information.

Click on the **link** to the discovered information right below the search box.

18

Here you can see the results from the search.

You can see [logs](#), [text files](#), [excel files](#), [.csv files](#) and [more information](#) is available to gather information.

- 19 In the [address bar](#), **type** the [following](#) and **press** Enter:

- 20 The [Whois.com webpage](#) is displayed.

Whois is a popular Internet registry that shows who owns a domain, how to contact them, and information about the website and even the servers that house them.

In the [search box](#), **type** the [following](#) and **click** Search:

[acilearning.com](#)

- 21 **Notice** that [ACI Learning](#) is unavailable, which means the URL is taken.

In the top left corner enter the following in the **Enter Domain or IP** search box:

[acilearning.com](#)

22

The **report for acilearning.com** is displayed.

Scrolling through, you can see when the site license was created and expired, tons of DNS information, administrative information, technical contacts, and other information about the website.

The screenshot shows the Whois website interface. The browser address bar displays <https://www.whois.com/whois/acilearning.com>. The page title is "acilearning.com" with a sub-header "Updated 6 days ago". The main content area is titled "Domain Information" and contains the following details:

Domain:	acilearning.com
Registrar:	Amazon Registrar, Inc.
Registered On:	2020-01-28
Expires On:	2029-01-28
Updated On:	2023-08-14
Status:	clientDeleteProhibited clientTransferProhibited clientUpdateProhibited
Name Servers:	ns-1518.awsdns-61.org ns-156.awsdns-19.com ns-2004.awsdns-58.co.uk ns-883.awsdns-46.net

On the right side, there is a section titled "Interested in similar domains?" with a list of domains and "Buy Now" buttons:

- aci-learning.com
- aciteaching.com
- aciliteracy.com
- workacilearning.com
- acilearning.net
- acilearningacademy.com

Below this list is a red banner with the text ".space" and a "Sale" tag.

23

In the **address bar**, **type** the **following** and **press Enter**:

<https://website.informer.com>

The screenshot shows a web browser with the address bar containing the URL <https://website.informer.com>. A dropdown menu is visible below the address bar, showing suggestions:

- <https://website.informer.com>
- <https://website.informer.com> - Bing Search
- ACI Learning - BuiltWith Company Profile - <https://builtwith.com/company/ACI-Learning>
- <https://website.informer.com/gw.detroitmi.gov>

The background of the page shows the Whois website interface, with the "Domain Information" section visible.

24

The **Website Informer webpage** is displayed.

This site allows users to look up a website to gain more insight about the site.

In the **search box**, **type** the **following** and **click Search**:

acilearning.com

25 **View** the **information** available from the search results.

General Info gives a general run down of what the organization that has the website does.

26 **Click View All** in the **Whois** pane.

27 The **Whois Information** is displayed.

You can see the same info you saw when you searched for it.

28 In the **address bar**, **type** the **following** and **press Enter**:

https://social-searcher.com

29 The **Social Searcher webpage** is displayed.

This site allows users to search for a keyword, users, and trends on 11 social media platforms in one search.

In the **search box**, **type** the **following** and **click** the **Search icon**:

acilearning.com

30 **Notice** the **results** from the search.

Posts from **crunchbase.com**, **Reddit**, **Vimeo** and **more** can be seen.

This very valuable tool demonstrates oversharing information in a quick and easy search.

Account monitoring can be enabled so administrators can be notified if posts are created on **acilearning.com**.

Exercise 2 – Threat Intelligence Hunting and Sharing

Threat hunting means looking for cyber-attacks and advanced persistent threats. Threat hunting is a deep search for the trail left by an individual who might have broken into the network and could be a threat. After getting into a network, an attacker can stay there for months gathering data, looking for confidential information, or getting login credentials that will let them pivot and move laterally across the environment. Once an attacker has avoided being found and gotten through an organization's defenses, many organizations don't have the advanced detection tools needed to stop persistent threats from staying in the network. Threat hunting should be an incorporated part of any defense plan. Companies try to keep up with the latest cyber threats and are ready to respond quickly to any possible attacks. There is a lot of information to sift through for just 1 computer; now consider a network. Analysts will look for indicators of compromise, which are bits of trace evidence that can be investigated to detect possible malicious activities on a system or network, such as data contained in system

log entries or files. Like looking at a website in the previous exercise, this can be a manual process or be aided using tools. Common indicators of compromise include but are not limited to:

- Unusual Network Traffic
- Privilege Escalation
- Failed Login Attempts
- Off-Hour Login Attempts
- Increased Access to Files and Databases
- System File and Registry Changes
- Unusual DNS Activity
- Signs of DDOS
- Unusual IP Address Activity
- Log Clearing

In this exercise, you will learn about threat intelligence hunting and sharing.

Learning Outcomes

After completing this exercise, you should be able to:

- Employ Incident Response using SIEM
- Use a Honeypot Tool
- Use MITRE ATT&CK to Identify Tactics, Techniques, and Procedures (TTPs)
- Access and Research Logs using Windows Event Viewer
- Enable Firewall Logging

Your Devices

You will be using the following devices in this lab. Please power these on now.

- **ACIDC01** – Windows Server 2022 – Domain Controller
- **ACIWIN11** – Windows 11 – Domain Member Workstation

Task 1 – Employ Incident Response using SIEM

The term incident response refers to the steps taken by an organization after a privacy breach or cyberattack. The end objective of incident response is to reduce the damage, minimize recovery time and expenses, and prevent secondary effects like ruined brand reputation. It is essential for businesses to have a well-defined incident response strategy. Employees can go to this plan for clarity and direction on how to proceed when an event happens. It's also a good idea to have training exercises involving the teams, workers, or leaders who oversee the incident response program and carry out each action in the plan.

In this task, you will employ incident response using Security Information and Event Management (SIEM).

1

Connect to [ACIWIN11](#).

Click the [Microsoft Edge icon](#) on the taskbar.

2

The [Microsoft Edge browser window](#) is displayed.

Type the [following](#) into the [browsers address bar](#) and **press Enter**:

[microsoft sentinel](#)

3

Scroll down and **click** the [Microsoft Official Site | Microsoft Sentinel link](#).

4

Here you can see [Microsoft Sentinel](#) is a feature offered by the [Azure cloud](#).

The acronym SIEM stands for "security information and event management," a technology that aids businesses in identifying, analyzing, and responding to security threats before they cause disruptions. A SIEM helps businesses respond quickly to security threats and maintain regulatory compliance by monitoring network activity. Over the past decade, advancements in SIEM technology have enabled faster and more accurate detection of threats and responses to incidents through the use of artificial intelligence. You can get a general idea of pricing per user and other highlights of using this [SIEM](#).

Like Microsoft, there are other SIEM options available that can help to analyze the logs and traffic in the network to cut down manual analysis. These are typically going to be paid services, however, due to the heavy investment in time by the program creators.

Review the [information available](#) on the webpage.

Keep the [Microsoft Edge browser window](#) open.

Task 2 – Use a Honeypot Tool

A honeypot is a hardened system connected to a network and is set up as a trick to catch threat actors trying to get into information systems without permission. A honeypot's job is to show up on the internet as a possible target for attackers, usually a server or other high-value asset, collect information, and let defenders know when unauthorized users try to get into the honeypot. Large businesses and companies researching cybersecurity often use Honeypots to find and defend against attacks from advanced persistent threats. To actively defend themselves from attackers, major enterprises often employ honeypots. Honeypots are also useful for cybersecurity researchers who are interested in learning more about the techniques, tools, and procedures used by attackers.

In this task, you will use a honeypot tool.

1 **Connect** to **ACIWIN11**, where the **Microsoft Edge browser window** is open.

Type the **following** into the browsers address bar and **press Enter**:

honeypot threat map

2 **Select** the **CIC Honeynet search result**.

3 The **CIC Honeynet site** is displayed.

Scroll down on the **page** to see the different clickable items to better help understand real-time attack behavior.

4 **Click** **REAL-TIME ATTACK MAP**.

5 A new browser tab opens with a **Real-Time CIC Attacks Map**. Notice the attacks on the honeynet being recorded.

Notice the **number of attacks** that are happening in a minute.

Close the **tab**.

6 **Click** **BI-WEEKLY REPORTS**.

7

The page with the reports is shown.

Click the **first available one** to review and get an idea of the information the report contains.

8

The report opens, and you can see information like the timeframe for the report, types of attacks that were performed, statistics about attacking countries and more.

Review the **report**.

9

Click the **back arrow** on the **browser window**.

10

Click **OUR DATA SET**.

11

The build of the **honeynet** is shown, giving us an understanding of the equipment used.

Review the **page** and **click** the **back arrow** on the browser window.

12

Click **HONEYPOT SOFTWARE**.

13

The software that is used in the honeypot is displayed.

Review the **page** and **click** the **back arrow** on the browser window.

14

Click **ATTACKER'S SOFTWARE**.

15

The software that attackers are using is listed.

Review the **page** and **close** the **tab** returning to the web search tab.

Keep the **Microsoft Edge browser window open**.

Task 3 – Use MITRE ATT&CK to Identify Tactics, Techniques, and Procedures (TTPs)

Cybersecurity experts use the term "TTPs" to describe the actions, processes, and strategies that a threat actor uses to create threats and launch cyberattacks. Tactics are the attack's main goals and the general plans that the threat actor used to carry out the attack. For instance, the threat actor may want to break into a website to steal PII about customers. Techniques describe how the attacker did the attack, like e-skimming or cross-site scripting (XSS). Procedures refers to creating a step-by-step explanation of how the attack was put together, including the tools and methods used. Most of the time, cybersecurity analysts use the steps of an attack to build an account or signature for a threat actor or threat group. A key part of a security program for information is knowing the TTPs of an attacker.

In this task, you will use MITRE ATT&CK to identify TTPs.

- 1 **Ensure** you are connected to **ACIWIN11** and the **Microsoft Edge browser window** is open.

Type the **following** into the **browsers search box** and **press Enter**:

mitre att&ck

- 2 **Click** the **MITRE ATT&CK search result link**.
- 3 The **MITRE ATT&CK page** is a repository of data detailing the methods and techniques that advanced persistent threat organizations have employed in actual intrusions.

ATT&CK stands for **Adversarial Tactics, Techniques, and Common Knowledge**, and is a compilation of in-depth accounts of these threat actors' observed tactics, techniques, and procedures.

Click **Matrices** on the upper menu pane of the webpage and **select Enterprise**.

4

The **Enterprise Matrix page** is displayed.

There are several categories listed below that break down into subcategories.

Click the **Reconnaissance category**.

5

Here you can see a breakdown of techniques used in the reconnaissance phase.

Click **Active Scanning** under the **Techniques section**.

6

Review the **page** discussing what active scanning is, how to detect it, and how to mitigate it.

Feel free to **review** any other **techniques** listed on the left pane of the screen.

When finished reviewing, **click** **Tactics** and then **select** **Enterprise** from the drop-down menu.

7

The **Enterprise tactics page** is displayed.

Review the **options available** and **click** **Privilege Escalation**.

8

There are several **Techniques** listed with subcategories in each.

Review the **option** and **click** **Abuse Elevation Control Mechanism** at the top of the page.

Here you can see **mitigation recommendations** and how to detect the act.

You can view the depth this site offers to help understand how attackers attack and how organizations can protect themselves.

Close the **browser window**.

Task 4 – Access and Research Logs using Windows Event Viewer

Event Viewer logs, firewall logs, IDS logs and protocol analyzers are a great way to look for unwanted activities.

In this task, you will access the Windows Event Viewer and search for common Event IDs to be on the lookout for.

1 **Connect** to ACIWIN11.

Right click the Windows Start Charm and **select** Event Viewer.

2 In the Event Viewer window, **expand** the Windows Logs section and **select** Security.

3 In the Security tab, you can look for potential threats to security events like authentication.

In the Actions pane, **click** Find.

In the Find window, **type** the following and **click** Find Next:

4624

4 The results are displayed at the at the bottom of the page.

Close the Find pop-up window.

5 **Click** Details and **expand** any hidden information by **clicking** the + next to each category.

The information displayed describes the event.

The date & time the logon occurred, the computer used, the user account used, and the login failed can be viewed.

Out-of-office hours login events may be an indication of a compromised account.

6 In the Actions window, **click** Find.

In the **Find pop-up window**, **type** the **following** and **click Find Next**:

4765

7

Event ID 4765 is for SID History being added to an account.

This can be an indicator of **privilege abuse** and **malicious activity**.

The search looks through the log and returns no events.

Click OK.

8

This same search process can be used for other **Event IDs**.

Note: You can research the different types of Event IDs that are available on the Microsoft website.

Scripting and third-party monitoring tools can alert analysts to these events occurring and cut down on some of the false positives that may occur.

Close the **Find pop-up window**.

9

Close the **Event Viewer window**.

Task 5 – Enable Firewall Logging

Insight into network activity may be gained by reviewing firewall logs. You can watch your firewall's activities, verify the effectiveness of rules, and investigate any security breaches. This feature is not enabled automatically and will need to be turned on.

In this task, you will access the domains group policy to turn on firewall logging.

1

Connect to **ACIDC01**.

The **Server Manager > Dashboard window** is displayed.

Click Tools and then **select Group Policy Management**.

2

In the **Group Policy Management** window, **expand** the following path:

Forest:ACIPLAB.COM > Domains > ACIPLAB.com > Group Policy Objects.

Right click Default Domain Policy and **select** Edit.

3

The **Group Policy Management Editor** is opened for the Domains Default Policy.

Expand the following path:

Computer Configuration > Policies > Administrative Templates > Network > Network Connections > Windows Defender Firewall

Select Domain Profile.

Double-click on Windows Defender Firewall: Allow Logging on the right pane.

4

In the **Windows Defender Firewall: Allow Logging** window, **select** the Enabled option.

Tick the Log dropped packets and Log successful connections checkboxes under the Options section.

There are additional options that can be configured below.

Review the Help pane to learn more about log locations and other information pertaining to this action.

Click OK.

5

Notice logging has now been Enabled for the Domain.

6

Close the **Group Policy Management Editor** window.

7

Close the **Group Policy Management** window.

Keep all devices that you have powered on in their current state and proceed to the review section.

Review

Well done, you have completed the **Threat Intelligence & Threat Gathering Concepts** Practice Lab.

Summary

You completed the following exercises:

- Exercise 1 – Collection Methods and Sources
- Exercise 2 – Threat Intelligence Hunting and Sharing

You should now be able to:

- Know about Open Source Intelligence (OSINT)
- Work with OSINT Tools
- Employ Incident Response using SIEM
- Use a Honeypot Tool
- Use MITRE ATT&CK to Identify Tactics, Techniques, and Procedures (TTPs)
- Access and Research Logs using Windows Event Viewer
- Enable Firewall Logging

Feedback

Shutdown all virtual machines used in this lab. Alternatively, you can log out of the lab platform.
